WHAT IS SODIUM?
Sodium is a mineral naturally found in many foods. It is commonly found in table salt and MSG, which is used often in restaurants and processed foods. Dietary guidelines recommend an intake of under 2,300 mg of sodium a day.

WHAT DOES SODIUM HAVE TO DO WITH BLOOD PRESSURE?
Sodium is a normal mineral in our blood. It is essential and important. It keeps our blood pressure normal by pulling water into our blood vessels. Without sodium in our blood, our blood pressure would drop and we would feel dizzy or weak.

WHY ARE HIGH SODIUM DIETS ASSOCIATED WITH HIGH BLOOD PRESSURE?
1. Our kidneys filter our blood, but they cannot remove all of the excess sodium that we consume.
2. There is excess sodium in the blood, which pulls the water from our tissues into our vessels.
3. This increase in blood volume leads to increases in blood pressure.

Sodium is a modifiable risk factor; decreasing dietary sodium intake to healthy levels can help blood pressure control and decrease risk of hypertension.

HOW MUCH SODIUM IS IN TABLE SALT?

| 1/4 Teaspoon | 575 mg sodium |
| 1/2 Teaspoon | 1,150 mg sodium |
| 3/4 Teaspoon | 1,725 mg sodium |
| 1 Teaspoon   | 2,300 mg sodium |

HIGH-SODIUM FOODS
- Cold cuts and cured meats
- Pizza
- Soups
- Burritos and tacos
- Chips, popcorn, pretzels
- Canned/frozen foods

WAYS TO LOWER YOUR SODIUM INTAKE
1. Limit/avoid prepackaged, processed and prepared foods.
2. Flavor foods with herbs, spices, lemon, or lime instead of table salt.
3. Look for lower-sodium foods or low-sodium versions at the grocery store.
4. Discuss diet and lifestyle changes with your health care provider.

WHAT IS CHOLESTEROL?
A waxy, fat-like substance consumed through animal products and produced by our liver.

WHERE DO WE GET CHOLESTEROL AND WHY IS IT IMPORTANT?

| Cholesterol is absorbed from our diet | Most of our cholesterol is made in our liver |
| Helps vitamin D production | Helps bile acid production for the digestion of fats |
| | Hormone production |

DANGERS OF HIGH CHOLESTEROL
Leads to plaque buildup in the arteries, which causes them to narrow
Narrowing blood flow to the heart and other organs increases risk for heart attack, stroke, and peripheral disease

SOURCES OF DIETARY CHOLESTEROL
Only animal products contain cholesterol.
- Egg yolk
- Shrimp and sardines
- Meat (beef, chicken, pork, lamb)
- Full-fat dairy (cheese, milk)
- Animal fats (ghee, butter)

HEALTHY CHOLESTEROL LEVELS

<table>
<thead>
<tr>
<th>TYPE OF FATS</th>
<th>GOAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Cholesterol</td>
<td>~200 mg/dL</td>
</tr>
<tr>
<td>LDL (Bad) Cholesterol</td>
<td>~100 mg/dL</td>
</tr>
<tr>
<td>HDL (Good) Cholesterol</td>
<td>For men: at least 40 mg/dL For women: at least 50 mg/dL</td>
</tr>
<tr>
<td>Triglycerides</td>
<td>Less than 150 mg/dL</td>
</tr>
</tbody>
</table>

LDL VS HDL
- Is made up primarily of cholesterol
- Increases risk for heart diseases (atherosclerosis aka plaque buildup, heart disease and stroke)
- 25–33% of cholesterol is carried by HDL
- Absorbs cholesterol in the blood and tissues and transports back into the liver to be broken down
- Lowers risk of heart disease and stroke

WAYS YOU CAN LOWER YOUR CHOLESTEROL

1. Choose foods lower in saturated and trans fats.
2. Incorporate some exercise into your routine.
3. Discuss diet and lifestyle changes with your healthcare provider.

PROTEINS

WHAT ARE PROTEINS?
Proteins are made up of building blocks called amino acids. Proteins help grow and maintain bones and body tissues such as muscle. They are also important because they make most hormones in our body, contribute to immune function, and provide a source of energy.

WHY EAT PROTEINS?
Proteins are important for:
- Growth
- Fighting infection
- Carrying fats, vitamins, minerals, and oxygen around the body
- Clotting blood
- Keeping fluids in balance
- Providing energy

Because we don’t naturally produce some amino acids, they need to be consumed through foods.

TYPES OF PROTEINS
- Meat, Poultry and Eggs:
  - Lean cuts of beef, lamb, goat, chicken, turkey
- Fish and Seafood:
  - Salmon, tuna, shrimp, and crab
- Low-Fat or Fat-Free Dairy Foods:
  - Yogurt, milk, and cheese
- Legumes:
  - Beans, peas, lentils, and soy
- Nuts and Seeds:
  - Walnuts and almonds

SO HOW MUCH?
The Recommended Dietary Allowance (RDA) for protein intake for most healthy adults is 0.8g of protein per kg weight of the adult per day (0.8g/kg/day). Consumption of protein should include a variety of foods. With all food intake, take into consideration all of the nutrients in the food, including, but not limited to protein, carbs, fats, sodium, and fiber content. A balanced diet consists of variety and moderation.

Estimated protein content
The amount of protein in each food listed below is an average. Protein content of foods may vary slightly depending on the manufacturer. Refer to the food label when available.

ESTIMATING PORTION SIZE
*If measuring spoons and scale are available, use them for better accuracy, instead of estimating portion size.

WHAT ARE CARBS?
Carbohydrates are one of our main macronutrients alongside proteins and fats. They serve as one of our sources of fuel.

WHY EAT CARBS?
Carbohydrates are important for:
- Supplying energy for our body and brain.
- Maintaining our digestive health through fiber-rich foods.

TYPES OF CARBS
There are three main groups of carbs:

1) STARCHES
- Whole grains (bread, tortillas, pasta, rice, etc.).
- Beans.
- Starchy vegetables (potatoes and corn, for example).

2) SUGAR
- Two main types of sugars exist:
  - Naturally occurring, such as in fruits and milk.
  - Added sugars, such as those found in cookies and sodas.

3) FIBER
- Fruits.
- Vegetables.
- Whole grains.
- Beans and legumes.

SO HOW MUCH?
The Dietary Guidelines for Americans (DGA) recommends that carbs should make up about half of total daily calorie intake in adults. Carb intake is measured in daily grams of carbs.

Therefore, based off a 2,000 daily calorie intake, about 250 grams of carbs should be taken in daily. Your daily recommended intake may be higher or lower depending on your daily calorie intake need.

The above recommended daily carb intake is for the average adult; however, it may be different for everyone. Please discuss with your health care provider what your daily calorie goal and carb intake goal should be, especially those with diabetes. A balanced carb intake of different types of carbohydrates, focusing more on those that are found in natural foods, should be considered when eating carbs.

FINDING YOUR DAILY CARB INTAKE

STEP 1:
\[
\text{TOTAL CARBS} \quad \text{(IN CALORIES)} = \frac{\text{TOTAL RECOMMENDED CALORIES}}{2}
\]

STEP 2:
\[
\text{TOTAL CARBS} \quad \text{(IN GRAMS)} = \frac{\text{TOTAL CARBS} \quad \text{(IN CALORIES)}}{4}
\]

BASED ON A 2,000 CALORIE DAILY INTAKE

STEP 1:
\[
\text{TOTAL CARBS} \quad \text{(IN CALORIES)} = \frac{2,000 \text{ cal}}{2} = 1,000 \text{ cal}
\]

STEP 2:
\[
\text{TOTAL CARBS} \quad \text{(IN GRAMS)} = \frac{1,000 \text{ cal}}{4 \text{ cal/g}} = 250 \text{ g}
\]

Discuss with your health care provider how to know how many grams of carbs are found in each type of food.
